KGE 2025

ECOLOGICAL RELATIONS BETWEEN MEMBERS OF THE MICROBIOME

Presented by
Virginia Leombruni,
Eleonora Giuliani,
Marc Shebaby

Introduction

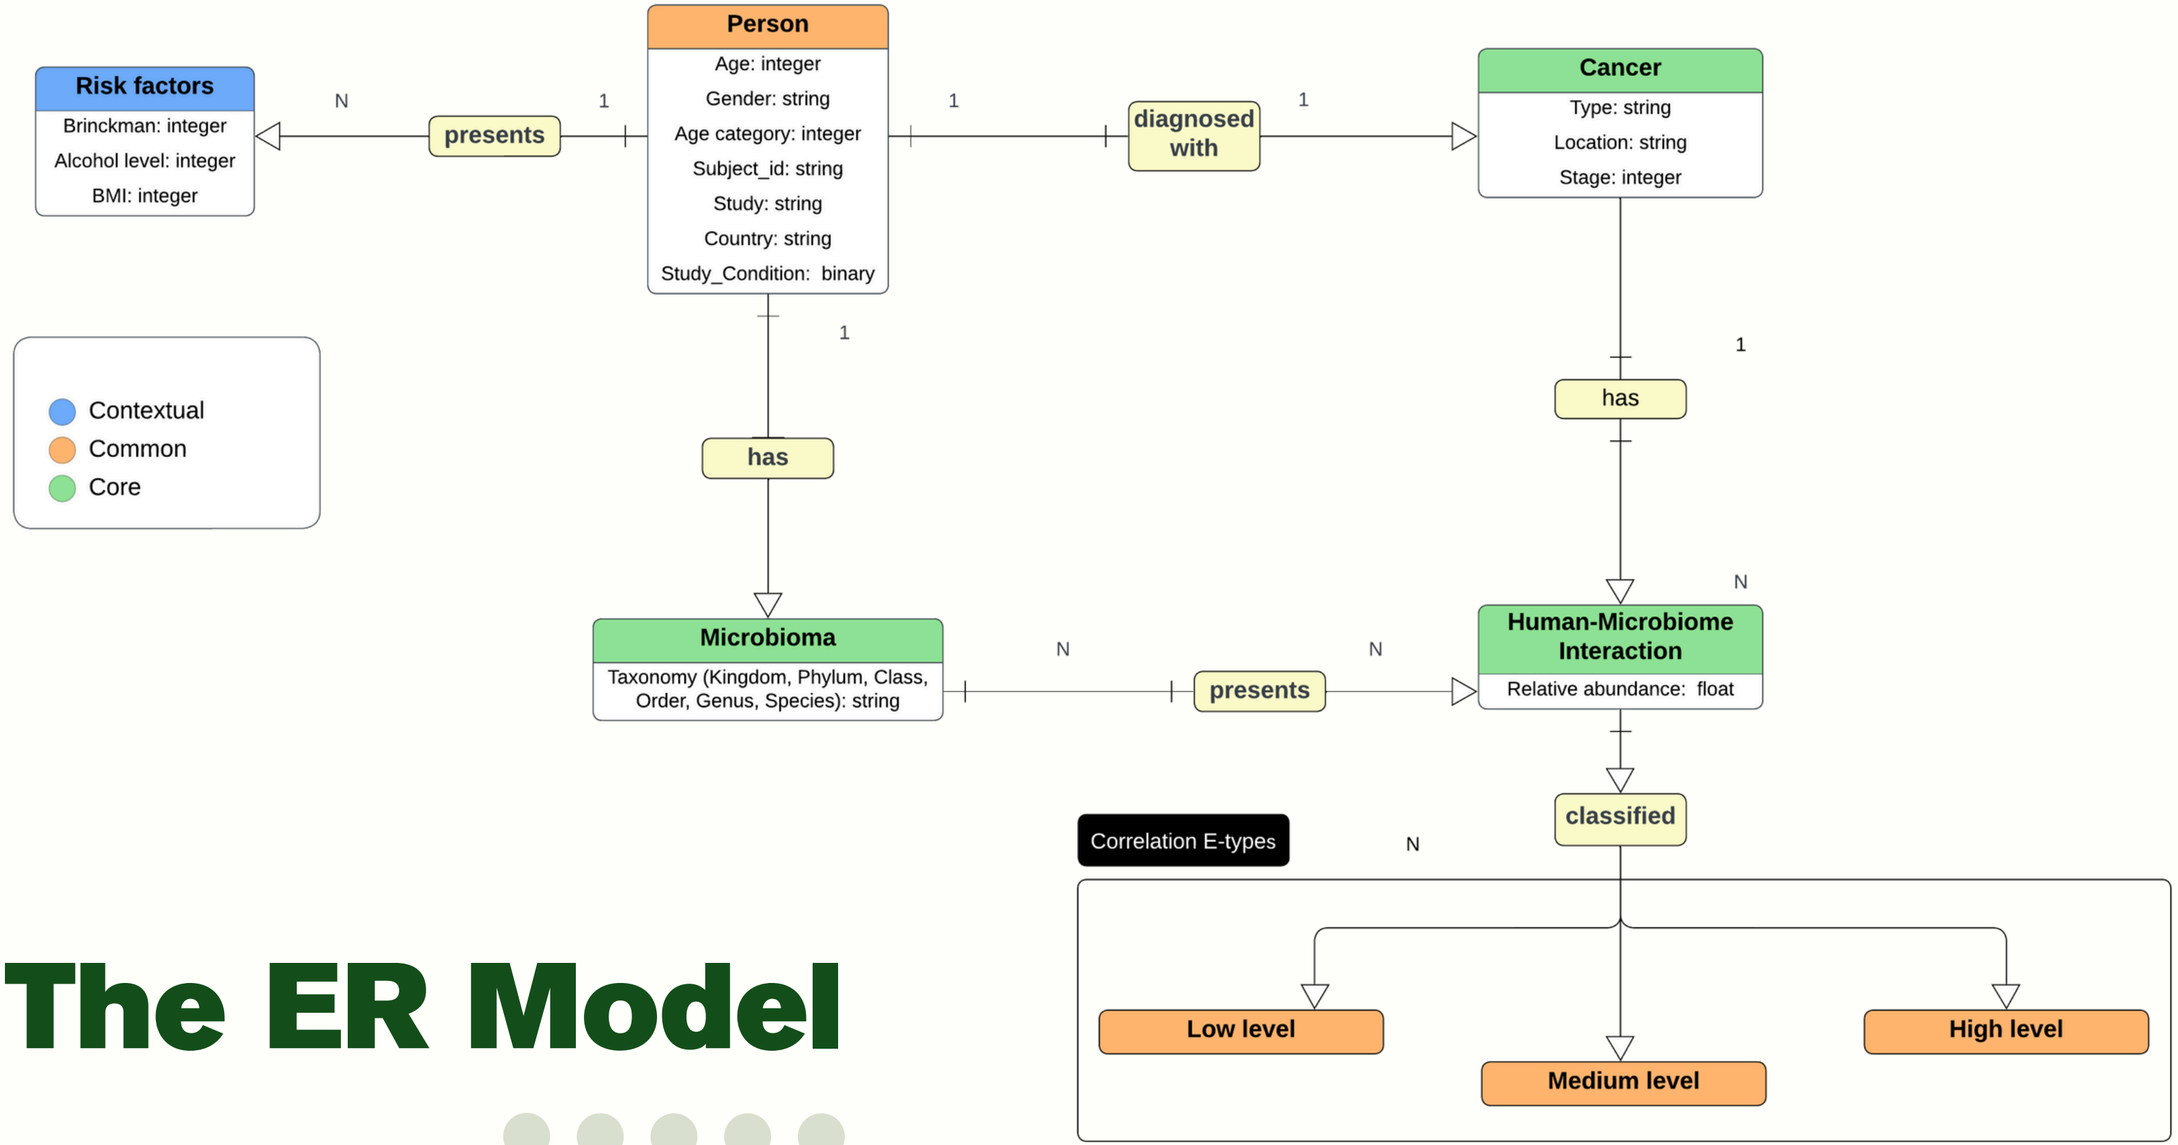
Microbial communities:

Microorganisms interact through competition, cooperation, and predation, influencing microbiome structure, stability, and species abundance.

iTelos methodology:

Enhances reusability and supports future applications.

The ER Model



Person
Age: integer
Gender: string
Age category: integer
Subject_id: string
Study: string
Country: string
Study_Condition: binary
Risk factors
Brinckman: integer
Alcohol level: integer
BMI: integer
presents
diagnosed with
Cancer
Type: string
Location: string
Stage: integer
has
has
Microbioma
Taxonomy (Kingdom, Phylum, Class, Order, Genus, Species): string
presents
Human-Microbiome Interaction
Relative abundance: float
classified
Correlation E-types
Low level
Medium level
High level
Contextual
Common
Core

N
N

Information Gathering

Objective: Standardize and prepare data for analysis.

Main Sources:

- MetaPhlAn3:
  Taxonomic abundances
- HUMAnN3:
  Functional metabolic potential

Chosen Dataset:

YachidaS_2019 dataset
(Carcinoma Cancer)

Process:

Data cleaning
and
Creation of a CSV file.

Language Definition

Problem: Ambiguity from polysemy of words ⟷ **Solution:** Use UKC to define concepts

Mapping:

Concepts mapped to UKC ontologies and BioPortal;
new IDs for terms (e.g., Brinkman Index).

Advantage: Resources already aligned, no further filtering needed

ConceptID	Word-en	Gloss-en
UKC-681	has_Medical_diagnosis	Identification of a disease from its symptoms
KGE-QCBI-2	has_Species	A person has a taxonomic group of sprecies whose memeber can interbreed
KGE-QCBI-3	has_Interaction	A species correlates with a with a particular person

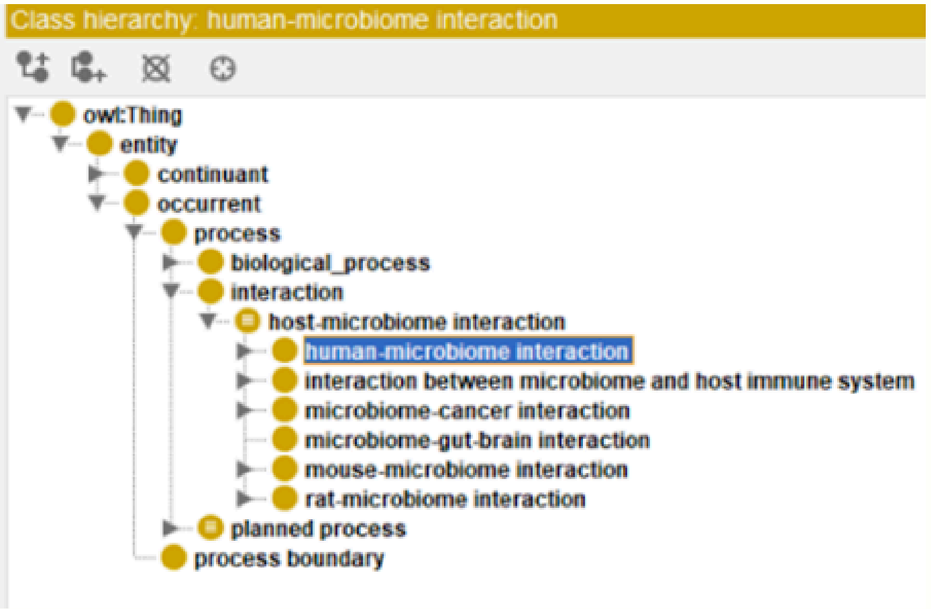
Knowledge Definition

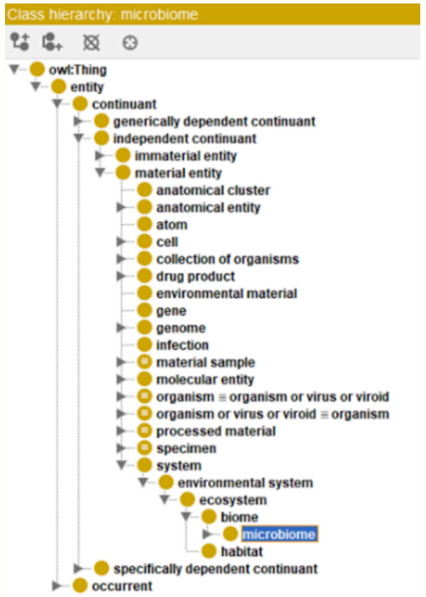
Goal

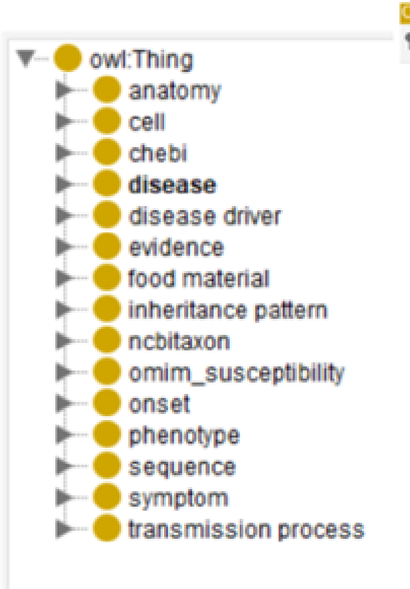
Develop a teleontology for the final KG to enhance interoperability and reusability

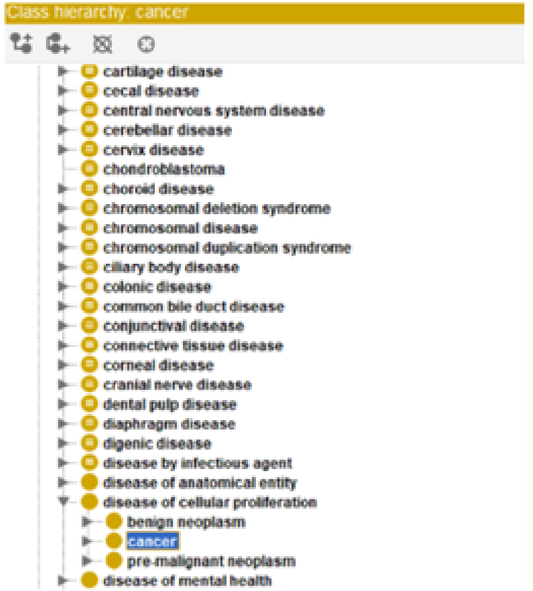
1. Producer Side: → Create interoperable ontologies for datasets:

- **OHMI**: Host-Microbiome Interactions
- **DOID**: Disease Ontology (cancer focus)





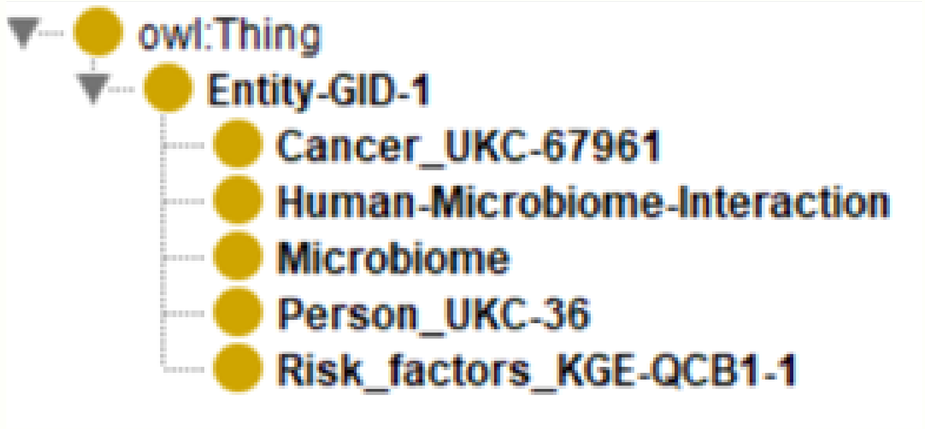




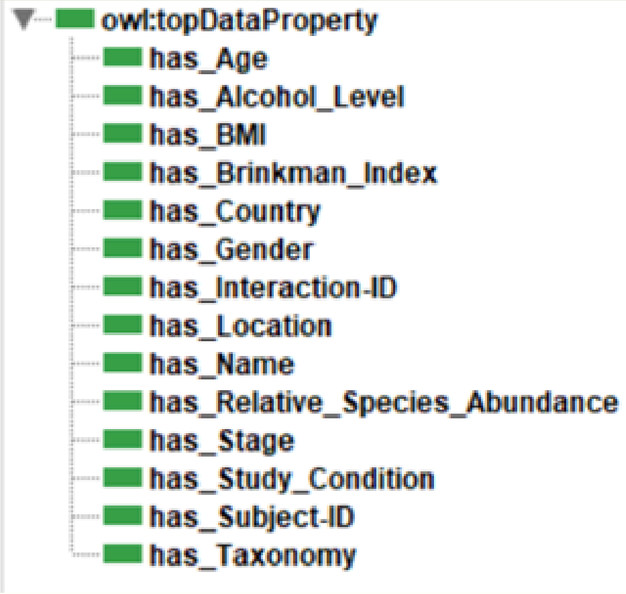
Knowledge Definition

2. Consumer Side

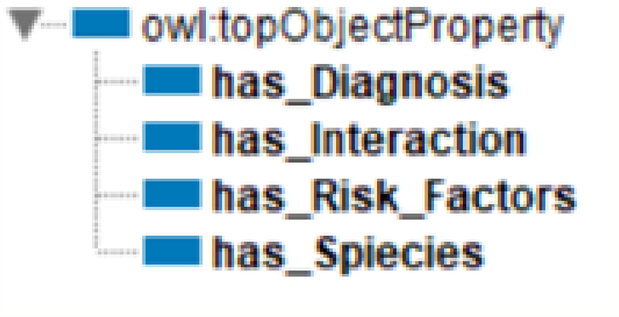
Build a unified **ontology** in Protégé:
Class hierarchies, object & data properties



Classes



Data Properties

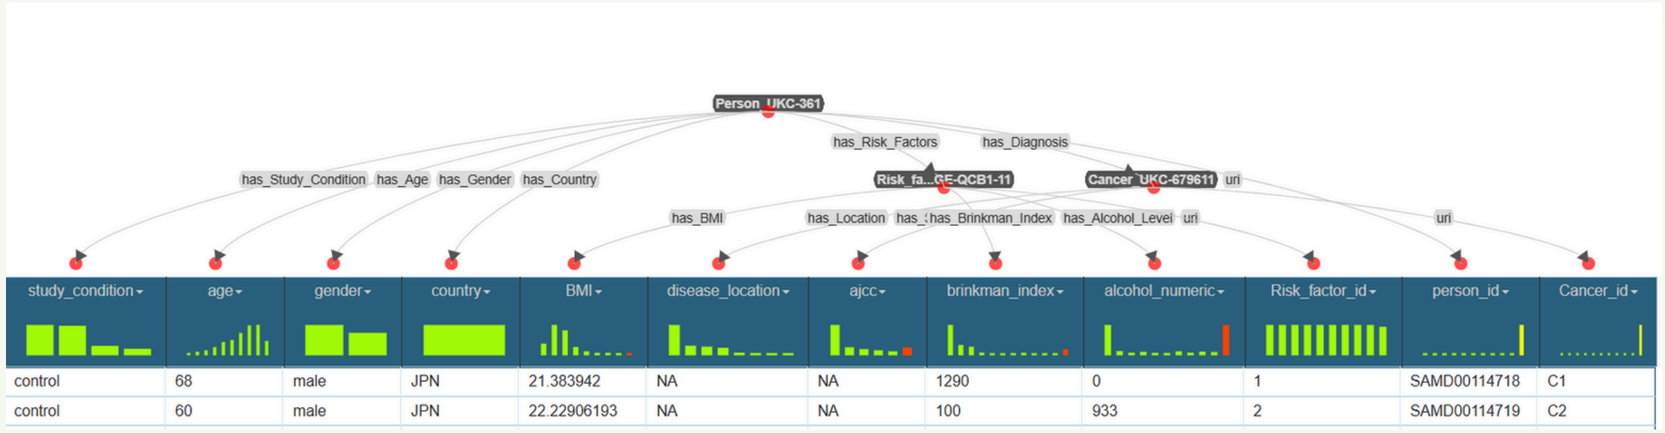


Object Properties

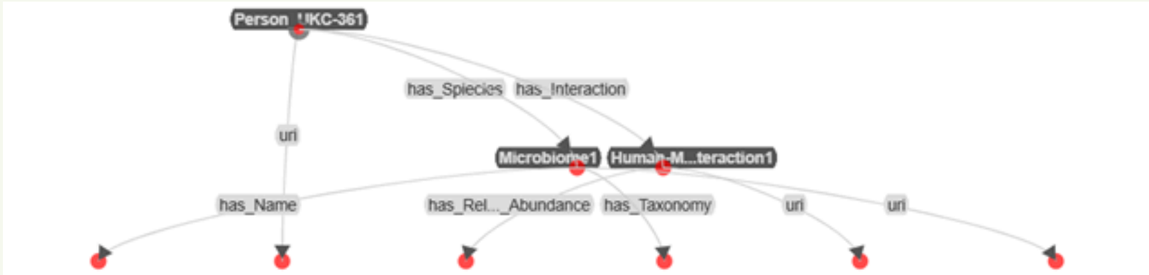
Entity Definition

Objective:

- **Merging** the knowledge and the data layers into a single structure
- Handling data value **heterogeneity** through entity matching and entity identification



study_condition	age	gender	country	BMI	disease_location	ajcc	brinkman_index	alcohol_numeric	Risk_factor_id	person_id	Cancer_id
control	68	male	JPN	21.383942	NA	NA	1290	0	1	SAMD00114718	C1
control	60	male	JPN	22.22906193	NA	NA	100	933	2	SAMD00114719	C2



Species_name	person_id	relative_abundance	taxonomy	interaction_id	Species_ID
Phocaeicola plebeius	SAMD00114718	54.94898	NA	1	Phocaeicola plebeius
Phocaeicola plebeius	SAMD00114719	11.23749	NA	2	Phocaeicola plebeius
Phocaeicola plebeius	SAMD00114720	19.09913	NA	3	Phocaeicola plebeius

Evaluation

Teleontology vs CQs

Teleontology vs Reference Ontologies

Entity level

$$\mathrm{Cov}_E(\mathrm{CQ}_E) = \frac{|\mathrm{CQ}_E \cap \mathrm{T}_E|}{\mathrm{CQ}_E} = \frac{5}{5} = 1$$

$$\mathrm{Cov}_E(\mathrm{RO}_E) = \frac{|\mathrm{RO}_E \cap \mathrm{T}_E|}{\mathrm{RO}_E} = \frac{3}{19699} = 0.0001$$

Property level

$$\mathrm{Cov}_p(\mathrm{CQ}_p) = \frac{|\mathrm{CQ}_p \cap \mathrm{T}_p|}{\mathrm{CQ}_p} = \frac{18}{19} = 0.94$$

$$\mathrm{Cov}_p(\mathrm{RO}_p) = \frac{|\mathrm{RO}_p \cap \mathrm{T}_p|}{\mathrm{RO}_p} = \frac{18}{178} = 0.1$$

Exploitation

QUERY 1: CQs about stage 4 cancer and high risk factors

person	alcohol	cig_level	species	occurrence_of_species	mean_of_species	stage

QUERY 3:
CQS about asscoiation of E.Coli with other species

Open Issues

- Additional data can be added to cover different types of cancer
- Time-series data provided by future studies can provide more insights on species-species interactions within the same individual
- Machine learning and statistical analysis is needed for precise and accurate results obtained from queries

THANK YOU FOR THE ATTENTION
